CSCI 1933 Fall 2019

To operate my program, compile all files in the zip file, and then run the main class. It will then ask you for input on board dimensions and such, do not enter dimensions larger than 12x12 but the dimensions must be at least 3x3. I was unable to implement the drone aspect into my code so I have removed my efforts of that (can upload if you would like). It will be set to debug mode and to change that, go into the main method and change debugStatus to false.

To rerun the program, simply hit run again.
